

Methods and Systems for Print-Processor Modified Printing

Abstract of Disclosure

Embodiments of the present invention comprise methods and systems which enable a user to distribute print tasks to a plurality of printing devices without the use of additional hardware for this purpose. These systems and methods are typically used in conjunction with a computer network comprising at least one computing device and a plurality of printing devices. Printing tasks which are typically sent to a single printing device may be distributed to multiple printing devices to increase printing speed, volume and/or capacity. This distribution capability can be achieved without the use of additional hardware and firmware and without modification to software applications.

Figures

Figure 1: A line graph showing the relationship between the number of hours spent studying and the score on a test. The x-axis represents the number of hours (0 to 10), and the y-axis represents the score (0 to 100). The data points are as follows:

Hours	Score
0	50
1	55
2	60
3	65
4	70
5	75
6	80
7	85
8	90
9	95
10	100
